**15-112 Summer-1 2017 Quiz 1**

**\*Up to 45 minutes. No calculator, no notes, no books, no computers. Show your work!  
No strings, list, or recursion!**

1. **Code Tracing** [20 pts]: Indicate what these print. Place your answers (and nothing else) in the boxes below the code.

```
y = 100
def ct1(x, y):
    for i in range(1, x, 3):
        if (i % 2 == 0):
            print("A:", i, end = " ")
        elif (i%10 == y%10): print("C:", i, y, end = "")
        if ((i**(0.5)) % 1 == 0):
            print("B:", i, end = " ")
        print()
        y += 1
```

```
ct1(10, 5)
print(y)
```

```
def ct2(x):
    y = 5
    for z in range(x+y, 10, -2):
        if (z > 20): print ('z', z, end = ' ')
        elif (z//10 == z%10): print ('z', z, end = ' ')
        for w in range(z, 20, y):
            y += 1
            if (w % 10 == 8): print('w', w, end = ' ')
```

```
print(ct2(8))
```

2. **Reasoning Over Code** [20 pts]: Find an argument for the following function that makes it return True. Place your answers (and nothing else) in the boxes below the code.

```
def f(x, y):
    assert((type(x) == int) and (type(y) == int) and (100 > x > y > 0))
    if (x + y == 50):
        z = 0
    else:
        z = 123
    while (x//10 != y//10):
        x -= 10
        z += 1
    return (x == z == 4)
```

x =	y =
-----	-----

```
def g(x, y):
    assert(type(x) == type(y) == int)
    assert(100 > x > y > 0)
    s = 0
    while (x > y):
        y += 3
        x -= 2
        s += 1
    return (s == 10)
```

x =	y =
-----	-----

3. **Free Response 1: formNumberFromOddDigits(n)** [30 pts]: Write the function `formNumberFromOddDigits(n)` which you may abbreviate as `f(n)` which takes a possibly-negative int value `n` and returns a new integer of the same sign that only contains the odd digits of the original input. So for example `f(9421)` returns `91`, since the only odd digits in `9421` are `9` and `1`. If the number contains no odd digits, then return `0`.

**4. Free Response 2: nthWithTwoOnes(n)** [30 pts]: Write the function `nthWithTwoOnes(n)` that takes a non-negative int `n` and returns the `n`th positive integer that contains exactly two ones. Thus, 11, 211, and 121 are such numbers, but 111 is not. Remember we always start counting from 0, so `nthWithTwoOnes(0) = 11`.
